SnapShell IDR is a revolutionary new tool for capturing driver's license information quickly and accurately.. SnapShell IDR is a Camera Based Scanner which can snap an image of an entire card at a blink of an eye, coupled with a powerful OCR engine that can parse almost any type of information from almost every Driver License.

SnapShell IDR's hardware consists of a high resolution CMOS digital camera encased in a small footprint scanner that snaps an image of an entire card and transfers it via a USB connection directly into SnapShell IDR's proprietary software – IDscan. Once receiving the data, IDscan can recognize and read Drivers Licenses from all 50 states as well as various courtiers around the world, and after extracting the data, IDscan can share and save it in multiple formats, providing maximum flexibility and seamless integration into existing infrastructures.

IDscan's advanced capabilities enable it to read printed texts using its OCR engine and "understand" both 1D and 2D barcodes.

The SnapShell IDR suite's accuracy and efficiency can be well implemented in various points of inspection:

- Retail/C Stores – Alcohol, Tobacco, Loss Prevention, Loyalty Programs, Drive Offs
- Pharmacy/Medical – Ephedrine Compliance (CEMA), Insurance Cards
- Banking – Checking cashing, Mortgage Authentication, Notary, New Account Creation
- Security – Access Control
- Government – DMV, Military, Border Crossing
